### **Removit**

Removit is the universal remover of shading agents and diffuse coatings. Suitable for all 'Q' (Q3 White, Q4 White, Q-Black and Q-Heat) and 'D' products (D-FUSE, D-FUSE Extra and D-GREE). After applying Removit, you can choose to let the product rain down or manually spray it off with water.

### **Dosage**

A mixture of 250 liters of Removit, diluted with approximately 1750 litres of water, is sufficient for the removal of one hectare of shadings and coatings from any greenhouse surface (glass, polycarbonate, film, acrylic). Add Removit to clean water while stirring.

### **How to apply Removit**

Apply the Removit solution by spraying onto a layer of shading agent or coating and make sure it is thoroughly moist. Allow Removit to soak in for 30 minutes before manually rinse it off the greenhouse deck with water or before rain is forecast. Use the Removit solution within 6 hours of preparation.

### **Remove Removit by rain**

If you choose to let the layer rain off, a few showers in the weeks following the application of Removit should be sufficient to fully rinse your greenhouse surface. In case of no or insufficient rainfall, manual removal of the shading or coating layer is advised.

### **Remove Removit manually**

After the Removit solution has dissolved the shading layer or coating you can start hosing down the shading layer. You can do this by using a fine nozzle or pressure washer and using plenty of water.

### **Environment and storage**

Removit complies with the requirements of the Dutch Decree on Emissions. Important: in order to avoid changes in the pH value of your irrigation water, we advise you to turn off your water during the application or removal of shadings and coatings. Removit is intended exclusively for the removal of 'Q' and 'D' products. Removit should be stored in a frost-free place and use for approximately 12 months.
